Coronavirus reverse genetics was performed in the two last decades using defective genomes, as cDNAs encoding full-length genomes were not available due to the large size of the coronavirus RNAs, posing relevant limitations. During the 1990s, reverse genetics in coronaviruses was possible by targeted recombination developed by Paul Master s group. Coronavirus reverse genetic systems: Infectious clones and ... The four different reverse genetic systems developed for CoVs are reviewed and discussed. • These systems were based on the use of BACs, in vitro ligation and vaccinia virus as a vector. • CoV reverse genetics is an essential tool for the study of CoV replication, virus–host interaction and pathogenesis. • Reverse Genetics of SARS-Related Coronavirus Using ...
